Periodontal therapy: a comparison of ultrasonic and sonic scalers. The purpose of this in-vitro study was to compare the ultrasonic and sonic scalers in removal of calculus and formation of debris from the marginal periodontal tissues. In the first experiment, 10 cavities were formed on the lingual surface of extracted human teeth and were scaled with the sonic and ultrasonic scalers at a working distance of 1.5 cm. In the second experiment, after cavity preparation, the teeth were scaled with each of the devices. At 1-minute intervals for 30 minutes, the occlusal surfaces were photographed to measure residual calculus.
