Deconvolution is a simple and powerful software program designed to help you get the best quality from your digital images. Use it to remove the blurring effects that have been added by your digital camera to each image that you take. Deconvolution is specially useful to iPhone and iPad users who just don't have a decent camera. Without any deep understanding of optics, you can still apply a large amount of great quality to digital images. When working with digital images, there are two major factors that affect the quality: resolution (the more pixels, the more quality) and sharpness. Most digital cameras have a resolution of around 4, 8, 12 megapixels, and some even larger. The higher the resolution, the more detail the image contains, and the more quality it will have. However, you get the best quality from your images with maximum sharpness. Unfortunately, most cameras add blurring while taking the picture, which makes the resolution worthless. To correct the bad image quality, you need software.

Deconvolution software works by applying a blurring algorithm to all the pixels in a digital image. This process allows you to sharpen the image, and it will improve the quality of your image. The Deconvolution process improves image quality, because it removes the unwanted blurring process that most digital cameras use to enhance images. If you want to use a high quality image processor, then Deconvolution is the answer to your prayers. Features: - Deconvolution algorithm. - Ultra-fast results. - Apply multiple algorithms for best results. - Automatic edge detection. - Sharpen pictures. - Resize and rotate images. - Preserve filesize. - Set default picture to work on. - Save the files to another place on your computer. - Graphic interface. - Save and open files. - Edit and view the pictures. - Image rescue from black and white. - Deconvolution on iPhone, iPad and other mobile devices. - Compatible with Windows and Mac. - Support JPEG, JPEG 2000, PNG, and BMP. - The program is completely free, and open-source. Pros: Deconvolution is a really simple and easy to use software program. Most of the functions are found in the right side of the application. Cons: The application doesn't have any real world presets in order to give you some guide with some

Do we count explicitly rejected questions as a negative? About page for protected users: So, my example question would be to remove a single button from a JFrame. I asked it, it got very little views (after being on the front page for some hours), I got it answered and everyone seemed to have a different take on it, and the next day it was closed because it was 'closed for reasons of moderation'. The question didn't receive any votes or upvotes, so I'm wondering why it's not considered a negative, despite it not meeting any of the criteria for deletion. (Plus, another one I posted is still open, so clearly we could delete questions without voters backing it up). A: That is a good question. It is up to moderators to judge if the question is indeed a bad question, not a normal user. If the question were to be posted now, I'd consider it as too broad, too basic and with poor English. It's broad because it suggests multiple different ways to realize the goal, which is too broad. It is basic because it would require way more effort than a normal user could put into a question. A: Under normal circumstances, I would say that it is a negative, however, not all questions need to be: An Interesting question for the community. A good resource for the community. Have value in understanding a subject. How a question was asked is only one factor in determining whether a question should be deleted: If the question is unanswerable, for example for lack of effort or because it's asking for a list of every possible way to do something. If it's a "why isn't my code working?", a "Why is this happening?" or a "How can I do this in X?" If it shows very little effort, or no effort at all. I think your example question qualifies on those points. There's no upvotes, it's not that great a question, and the community does the work of closing it. If there was a massive up-voting, you would probably be in the clear. A: This is a feature request that was brought to my attention. It's important to understand that why your question was closed has nothing to do with how the question should be 6a5afdab4c

With its non-destructive method, Deconvolution allows you to alter, enhance or even change your images. It's a program that can deblur your pictures, but it can also allow you to make some changes to them, such as changing the ratio, resize the photo, fixing the tape, and more. If you want to get rid of the tape, this is the application for you. It allows you to deblur your photos and change them to look like a shiny silver paper. It's not the most sophisticated software, but it will get the job done. The Hacker's Toolkit 2017 Edition is a collection of over 40+ high quality malicious and miscellaneous tools. To assess short-necked thyroglossal duct cysts (TDC) characteristics and complications in children. Retrospective review of patients with a diagnosis of TDC confirmed by preoperative ultrasound. Tertiary care paediatric medical centre in the Netherlands. A group of 836 children with a median age of 6 years (1.2-14 years) were diagnosed with TDC during 1999-2010. Of these, 117 children (14%) had a short-necked cyst. During a median follow-up of 28 months (3-75 months), three children (2.6%) developed a relapse of TDC (2.6%) and 12 children (10.2%) developed symptoms, signs and/or cervical inflammatory nodules (9.4%). Mean transverse size of the TDC at follow-up was 7.5 mm and mean longitudinal size was 7.1 mm. Two of these children were treated by excisional neck surgery, of whom one required a second surgical excision because of a relapse. One child received a short-necked TDC occluder and the majority underwent endoscopic marsupialisation. During the post-marsupialisation period, five children (4.3%) developed a relapse, which was treated successfully. Two patients needed a second marsupialisation procedure because of an unsuccessful initial marsup
