SAN Disk Toolkit is a utility which allows the user to read the S.M.A.R.T. information from all disk drives present in the system. Being a simple utility, it is highly capable of performing many tasks at once. It can scan for S.M.A.R.T. attributes such as voltage, temperature, NAND flash blocks, power on hours, program fail count, total written/erase count and percentage of total write/erase count. This enables the user to easily view the health and performance status of their disk drives. Furthermore, it is possible to download the list of S.M.A.R.T. attributes saved by the software. The invention relates to weather-resistant, ultraviolet- and weather-stable single- and multi-layer polymeric articles coated with a weather-resistant UV absorber of high glass transition temperature. In particular, the invention relates to polymeric articles which are coated by application of a coating, and which have a UV absorber of from 40 to 80 percent by weight, based on the total weight of the coating, of a glass transition temperature of at least 180.degree. C. In order to protect objects from the harmful effect of the sunlight, and also in order to prevent the sunlight from penetrating into buildings, it has been proposed to coat articles made of polymeric material with a UV absorber of high glass transition temperature. Thus U.S. Pat. No. 3,419,519 describes a silicone rubber compound for coating the interior of transparent containers which contains a solid material of high glass transition temperature which, in addition to the solid UV absorber, may also contain a UV absorber of organic nature which may be present in the form of a solution. The glass transition temperature mentioned is 180.degree. C. to 240.degree. C. U.S. Pat. No. 3,597,322 describes liquid coating compositions for coating masonry construction, which are capable of withstanding exposure to direct sunlight

and contain a solid material of high glass transition temperature, which may contain a UV absorber of organic nature and which may optionally contain a UV absorber of inorganic nature. The glass transition temperature mentioned is 180.degree. to 300.degree. C. Thus the prior art does not describe articles which are entirely coated with a single layer of UV absorber of high glass transition temperature, and the known technology does not describe UV absorbers in combination with single- or multi-layer coat
