===== Q: How to
eliminate duplicate values from Nested Structure I am receiving JSON data. So I have to parse it and store it in hash. How to avoid duplicates? I have to put the date inside json object. So it has to get rid of the repeated dates and store the one. I have tried the following. Any suggestion please? let hash = JSON.parse(response_body) .reverse.each {|d| puts d[:todays_date]} .map {|d| Hash[d.reverse.map {|k, v| [k,v.reverse]}]} .each_with_object({}) {|k,h| h[k] = Hash[h.reverse.map {|_,v| [v,k]}]} .map! {|d| Hash[d

Q: Explanation about the concept of circuit breaker Can someone explain me the concept of circuit breaker? Is it used to cut off power when there is a spike in current usage? In that case, how will it work? A: Circuit breakers are designed to cut power to your house in the case of a problem on the power line. The problem could be anything from a power line outage to squirrels chewing on power lines. (from fuzionstorm.com) A: A circuit breaker acts like a fuse, which is a much simpler device than a properly designed circuit breaker, used for safety purposes. A circuit breaker is actually a "line-interrupter", that is, it interrupts the circuit, (e.g. breaks the power line) when too much load is applied to it, which is determined by the ampere rating of the breaker. A circuit breaker works by first "disconnecting" the power line in the event of overload, and then current-limiting, or possibly even going back to normal (depending on the breaker, and what the limiting means is), and finally releasing the power line. In the event of a fault condition on the power line, such as a power outage, a short circuit, a breaker can be held open manually, (by the customer, to avoid the customer's home being cut off if he/she has an open switchboard circuit), and a power supply can also be connected to the breaker, and it will "spike" for a short period of time (typically less than ten seconds) as current limits are reached and the power is restored. A: Circuit breaker is a switching device that limits the current of electrical power. Circuit breaker uses the thermal effect of electrical current flowing through the small conductor. It is an electrical switch that occurs when the breaker trip due to overload, short-circuit, or other causes. it will interrupt circuit voltage or current in the event of overload. The circuit breaker is the
