Programming languages available in AutoCAD Cracked Accounts are: Autodesk Active-X: Controls such as the Ribbon and other components that make up the user interface are written in VBScript and Visual Basic for Applications (VBA), and can also be written in other scripting languages. These controls are always available when writing a script, and do not need to be registered. Scripts can be invoked via VBA or by importing the script and running it. Autodesk Delphi: Controls can be written in Delphi, and are activated with a "Click" or "double click". The application used to run the script must be installed on the machine on which the script is run. ObjectARX: A native class library based on the shared object (DLL) technology available on most operating systems, allowing AutoCAD Download With Full Crack to use native class libraries and code to avoid the need to use AutoLISP. This is often a great benefit for script authors because it allows them to take advantage of speedier execution of their code. However, it is also a major challenge as it requires the developer to write and maintain native code for every AutoCAD Serial Key application. As such, it is not suitable for creating a "plug-in" system. Visual LISP: Allows the creation of class library code that can be invoked from VBA or from within VBA code. As such, this language is sometimes called "DLL scripting". Visual LISP, is a script language designed for use with AutoCAD and has been available since AutoCAD V2, the development phase began in late 1990 and initial release in late 1992. Like Visual Basic, it is available through Visual LISP (VLISP) to Visual LISP (VLLS) to .NET (Visual Studio/VB.NET). VLISP and VLLS support the same features of Visual Basic but are slower to compile. Visual LISP Visual LISP is an interpreted language, and like most interpreted languages, it does not support procedural programming. All code must be declared in an object. VLISP code can be called from Visual LISP and from Visual Basic. The calling mechanism is similar to Visual Basic; the main difference is that VB must be present on the machine when the code is called. VB may be present when the VLISP code is

Q: PHP - using name variables as array indexes I have an object with a lot of properties and they all get turned into a key value pair in an array...  
`foreach($collection as $key => $value) { $data[$value['name']][] = $value['value']; }`  
But the properties in `$value['name']` are not always the same. They could be "group\_id", "group\_name", "group\_category\_id", or any combination of these. So how can I use `$value['name']` as the index in the following array?  
`foreach($data as $group_name => $group_data) { $groups[$group_name] = $group_data; }`  
For example, say I have the following array: `$collection = array( array('`
